Faster Electric Window Motors

\$259.95

Sold out. All gone.

I am finished with this new (last) batch.

NOTE: I bought all the OEM GM electric motor pairs this company had. 23 pair. So I'm making 23 kits.

After that I will not make anymore by using junk China motors. They are low quality. So if you are thinking of buying this kit do it soon before all 23 kits are gone.

8-9-2020: Sold out. All have been sold.

Upgrade to really fast electric window motors!

NOTE: Many things contribute to slow electric windows. All the electrical connections (starting at the battery) degrade over time, corrode etc. If the dew wipes are hard that can make them go slower. Wiring connections degrade over time. Switches get dirty. The tracks get full of dirt and the grease turns into putty. Another problem is aftermarket window electric motors are low quality. One can take everything apart and clean and relube everything.

You can also upgrade to HD electric window motors:

This was originally an idea of Fierobsessed on the Fiero Forum. Fierobsessed found these electric window motors and mounted these new motors on a steel plate and then mounted them on the Fiero window scissors lift assembly. The problem Fierobsessed had was clearance between these larger electric window motors and the channels the glass rides on. I looked at this for a length of time and devised a way to mount them lower providing more clearance by mounting the plates on top of the motors. Paul Smith worked with me to work out the kinks and he has installed them in one of his Fiero's and it worked out well. Although the clearance is minimal it was around 1/4".
